big-bang

matthias. racketeer

imagine

If x is 5 and y is 3,
what is $x * y + 8$?

It's all about numbers.

why not pictures?

A horse is on its way
from St. Louis to Chicago.
The horse manages a steady
speed of 5 miles per hour.
Develop a variable expression
that describes how far from
St. Louis the horse is after
 x hours.

movies?

Add green circle and a brown rectangle so that the result is a tree.

If x is

and y is

what do you get when you
place x into y at (0,100)?

A horse buggy is on its way from St. Louis to Chicago. The horse manages a steady speed of 5 miles per hour. Draw images of the scenery when it has been on its way for 10 hours, 50 hours, and 120 hours.

$t = 10$

$t = 50$

$t = 120$

```
cart(t) =
```

```
  place(,  
        5 * t,  
        white background)
```

An animation!

1995

help math with programming

If a kid *never* programs again, we *still did good*.

help programming with math

coordinate concurrent FP
(Folding the Network into the Language)

high school
(TeachScheme!)

college
freshman course
(How to Design programs)

middle school
(Bootstrap)

What I will show

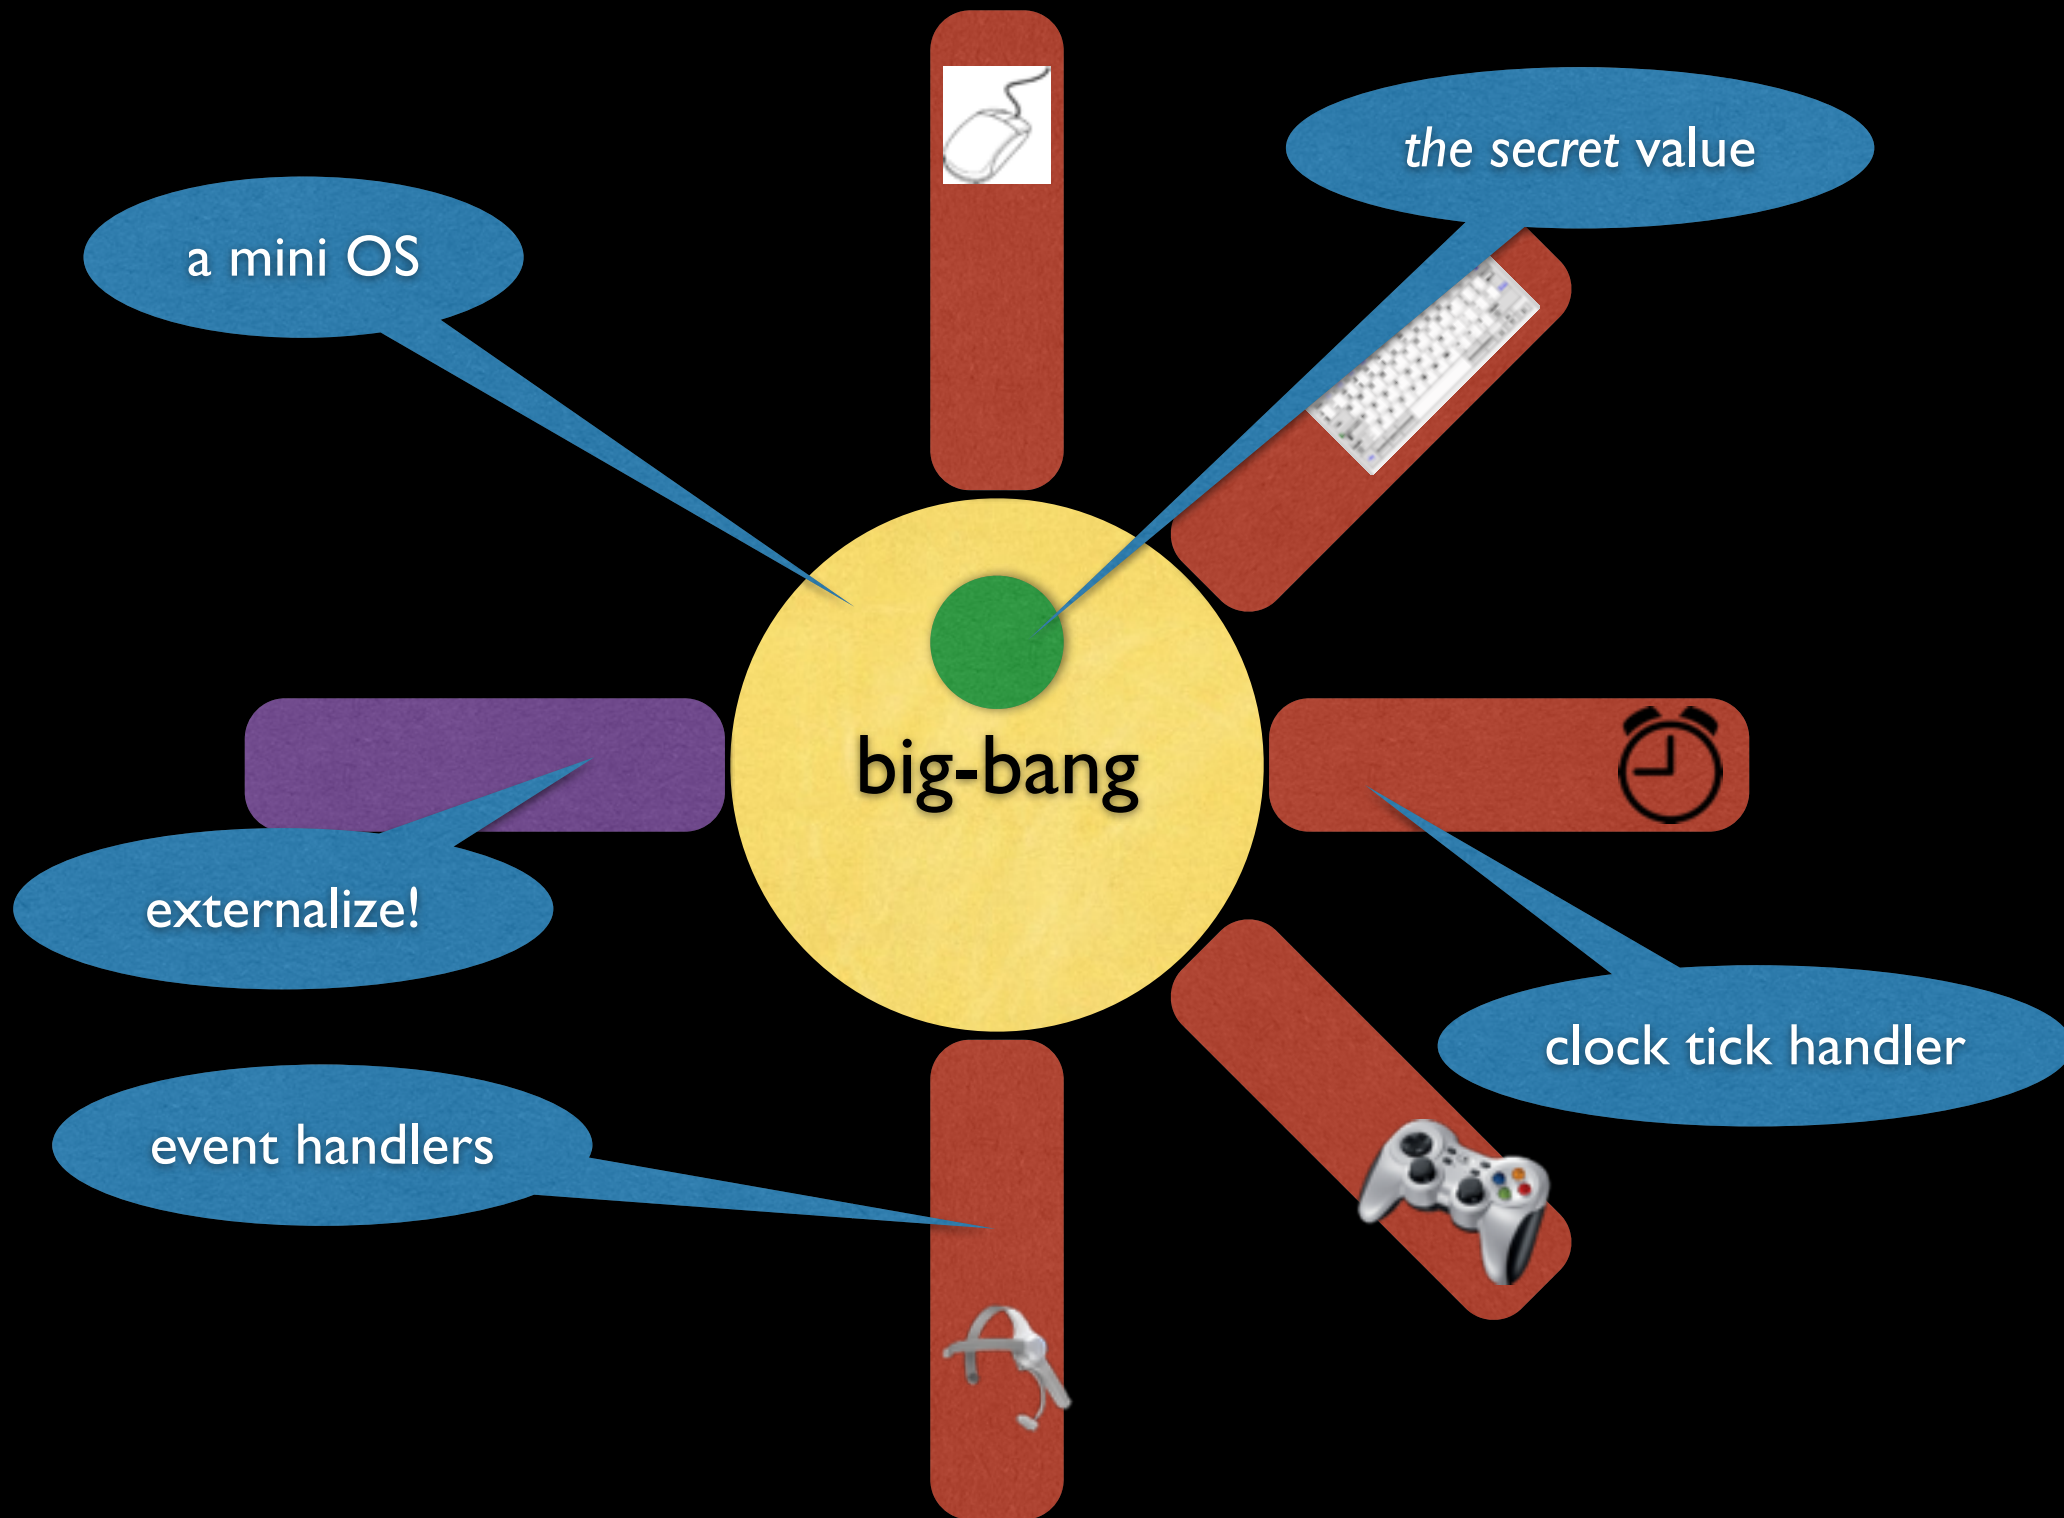

the programming
for this world

What I won't show

- the pedagogy
- the *design* approach
- the teaching langs
- the educational IDE

demo: from numbers to images and movies

big-bang

big-bang

describe a world declaratively

```
(big-bang State
  [to-draw      (State -> Image)]
  [on-tick      (State -> State)]
  [on-key       (State Key -> State)]
  [on-mouse     (State N N Mouse -> State)]
  [stop-when    (State -> Boolean)]
  ...)
```

```
type State ; students' choice
```

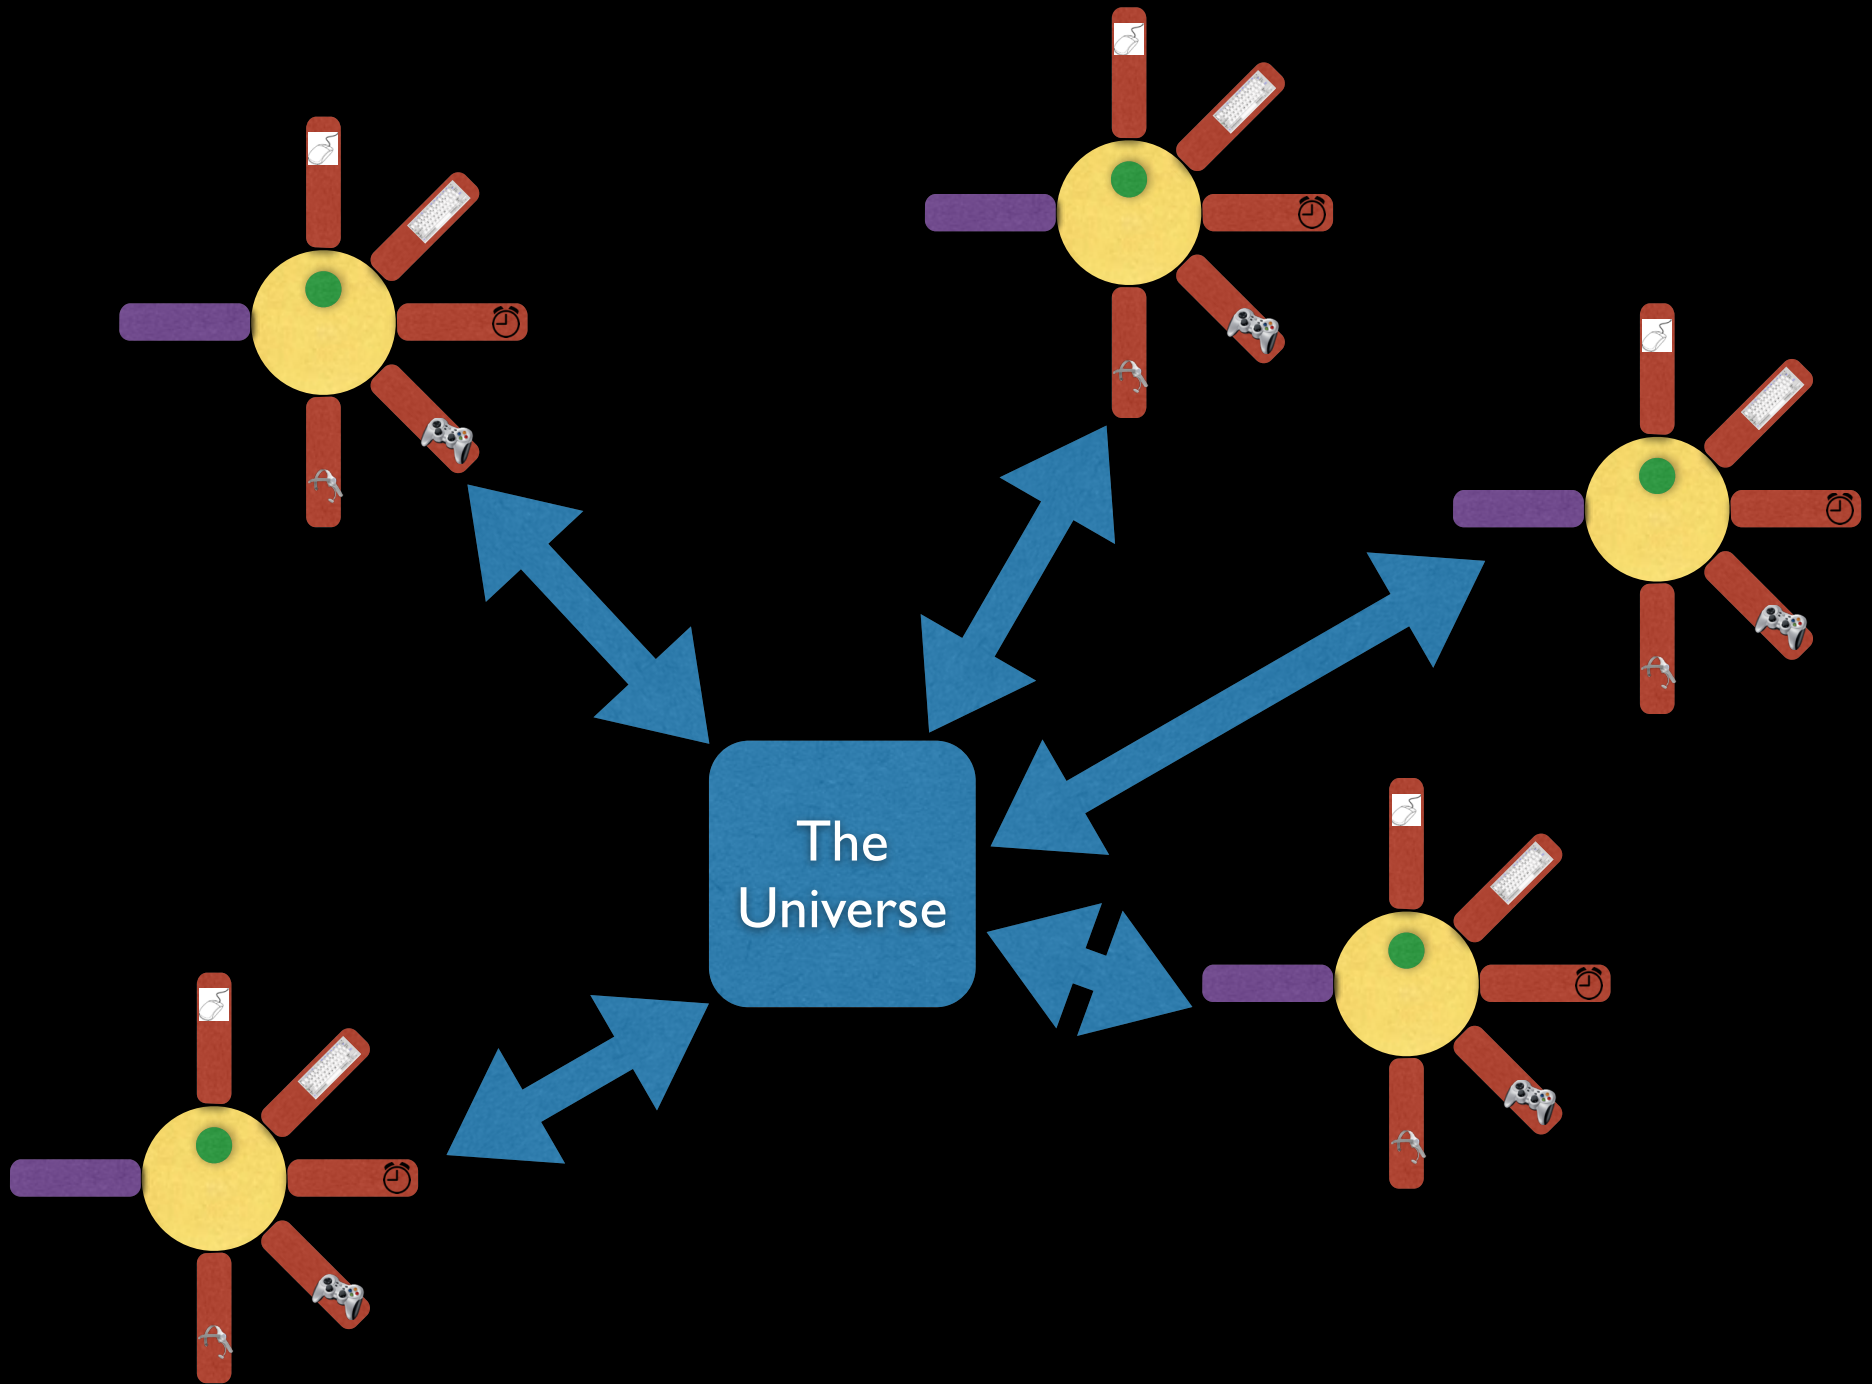

demo: big-bang

conditional functions

What is the value of sign for -3, 42, and 0?

$$\text{sign}(x) = \begin{cases} +1 & \text{if } x > 0 \\ 0 & \text{if } x = 0 \\ -1 & \text{if } x < 0 \end{cases}$$

universe,
the world is not enough

communicating worlds may send messages

```
(big-bang State
  [to-draw      (State -> Image)]
  [on-tick      (State -> State x Message)]
  [on-key       (State Key -> State x Message)]
  [on-mouse     (State N N Mouse -> State x Message)]
  [on-receive   (State Message -> State x Message)]
  [register     IP]
  [stop-when    (State -> Boolean)]
  ...)
```

```
type Message ; a serializable value
type IP       ; a representation of IP #s
```

universe is a central message broker

```
(universe State
  [on-new (State IWorld      -> Bundle)]
  [on-msg (State IWorld Message -> Bundle)]
  ...)

type State ; students' choice
type IWorld ; representation of communicating world

type Bundle = State x [Mail] x [IWorld]
type Mail   = IWorld x Message
```

-
- The diagram illustrates a multi-layered system architecture. At the top, there are four small yellow circles on a blue bar, with an upward arrow pointing to a single yellow circle. Below this is a row of eight yellow circles, with a blue bar labeled 'multi lingual' underneath. A double-headed blue arrow connects this bar to another blue bar labeled 'assertions' below it. A thick red horizontal bar separates the 'assertions' layer from the bottom layer. The bottom layer features three large yellow circles on a blue bar, with a double-headed blue arrow connecting this bar to a blue bar at the very bottom labeled 'WAN & subscribe'. A large green oval callout is positioned in the center, containing a list of five items, with a green line pointing from the bottom layer to it.
- concurrency
